Scary Dark Skulls Windows 7 Theme Product Key is quite a quality theme because it comes with keytones as well that let you customize the whole theme to your will. So you can choose between the dark and scary theme, or you can have your desktop with some special and neat wallpapers that are fully integrated in a simple and intuitive interface. Only a few easy steps later, you are good to go and you have yourself a rather dark and scary desktop environment to admire. While a standard Windows 7 theme should have some special keytones, Scary Dark Skulls Windows 7 Theme comes with a total of twenty-seven keytones that let you customize each aspect of your Windows 7 experience. And you do not even have to dig into your hard drive for the additional keytones because the keytones are all included in a folder with the theme. It is easy to change between the different keys using the included button at the bottom of the theme. The button is all you need to change between the different keytones and listen to the strange noises that are all playing together. All sounds are very scary, some scary and even cold-hearted enough to make you feel uneasy and to raise your mood a little bit. A total of six different keytones work together to give you a more diverse experience. The strongest of them are the default keytones that are included with the theme. But there are also options for those who want to experience the theme with a different effect. Scary Dark Skulls Windows 7 Theme is a well-executed theme that does not demand much from the end user, but the scary dark skins that are already included in the theme are rather great. Plus, the keytones are rather good as well. So if you enjoy a lot of horror, then this theme may be for you. 1d6a3396d6

Q: Why does my hash with two equal arguments work in Ruby? I have been thinking about hashes for a long time, and I still don't understand the following: `h = {} h[1, 2] = 3 h.keys.first => 1 h.keys[1] => 2 h.keys.first => 2` Why doesn't `h[1, 2] = 3` try to set the value at key 1, instead of key 2? A: As Ruby::Hash is based on Hash you can think of it as a tree data structure. If you have a tree you can imagine it as having a parent and a child. So when you ask for a parent it will return you the parent (and so on) until it finds the correct one. If you were to write: `h[1, 2] = 3` h is a Hash object, if you ask for the parent of h you will get back the child. You can see this in action here: `h =`
